Tiger Sanitation — Collection Liquidation & DSO Impact Analysis

Full-book review of 19,945 placements, May 2018 through July 2026

ADS Client Key: 5317 · **Client:** Tiger Sanitation, 6325 US Highway 87 E, San Antonio TX 78222 · **Prepared by:** Southwest Recovery Services, LLC
Report date: September 04, 2026 · **Source:** ADS SSRS "Account Summary – w DOR-DOA" full export (20,251 rows) · **Reconciliation:** ties to SSRS control totals to the penny

FRAMING NOTE This report is constructed around **Days Sales Outstanding** as the governing KPI, at the client's direction, for presentation to Tiger Sanitation corporate management. Every recovery figure is additionally expressed in DSO-equivalent days. Revenue-dependent figures use a third-party estimate and must be re-run on audited revenue before external presentation — see §15.

1 Executive Summary

Tiger Sanitation has placed **19,945 accounts** totalling **$4,598,228** with Southwest Recovery Services across **2018–2026**. Gross recovery to date is **$748,239**, a lifetime liquidation of **16.27%**, with **$3,828,889** still open.

> **Read the headline number correctly before anything else.** The 16.27% lifetime figure is a blended average of two very different books. The **seasoned book** (12,045 accounts, $2,496,942 placed before January 2026) has liquidated at **27.24%** — a strong result for consumer receivables at a $230.55 average balance. The **2026 book** (7,899 accounts, $2,101,015) is only 5.4 months old and sits at 3.24%. Roughly 46% of every dollar Tiger has ever placed arrived in a single 2026 backlog release and has not yet had time to perform.

- **Placement age is the controlling variable — and it maps directly to DSO.** Measured on fully seasoned cohorts only, terminal liquidation runs **35.51%** when accounts reach SWRS at 91–180 days past due, but falls to **17.51%** at 1–2 years and **9.01%** beyond three years (§7). The number of days an invoice sits on Tiger's books before assignment is the single largest determinant of whether it is ever recovered.
- **The 2026 backlog was held 542 days on average before placement.** Running that cohort's actual age-mix through Tiger's own observed decay curve projects a terminal recovery of **18.25%** — about **$383,377**. Had the same dollars been placed inside the 91–180 day window, the same curve projects **$746,156**. The delay costs approximately **$362,779** on this cohort alone (§8).
- **A 19-month placement gap preceded the backlog.** No accounts were assigned between August 2024 and January 2026. That pause is what converted a routine flow of 90-day receivables into a $2,101,015 aged block.

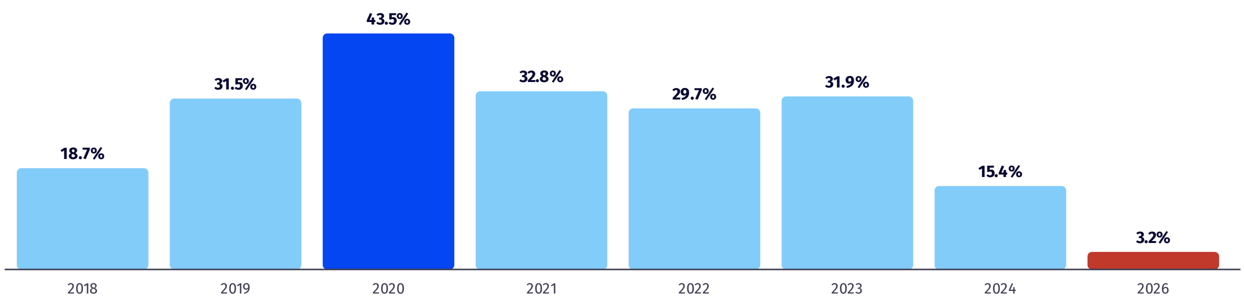
- **In DSO terms.** Against an estimated $89,600,000 of annual revenue, the current open placed balance of $3,828,889 represents **15.6 days** of DSO-equivalent receivable, and 2026 placements alone represent **8.6 days** (2.34% of revenue). Publicly reported peers in solid waste run provisions for credit losses of roughly **0.1%–0.5% of revenue** and DSO of **38–51 days**[1,2,3,4,5,8] (§3, §10).
- **Where the recoverable money still is.** $3,627,866 of open balance is workable (not compliance-blocked). Applying observed terminal rates to cohorts still in flight yields **$315,265** of additional expected gross recovery from placements already in house (§9). Everything beyond that requires a change in placement timing, not more time on the existing file.

2 Portfolio Position

Full-book position as of September 4, 2026, reconciled to the ADS SSRS control totals. Figures are net of 306 client-recalled accounts ($82,446); gross-of-recall totals are footnoted in §15.

PLACEMENT YEAR	ACCOUNTS	PLACED	COLLECTED	OPEN	PAYERS	AVG AGE AT PLACEMENT	LIQUIDATION
2018	2,000	$697,973	$130,227	$562,787	650	209 d	**18.66%**
2019	1,653	$257,563	$81,053	$176,581	682	133 d	**31.47%**
2020	246	$152,379	$66,236	$86,143	85	114 d	**43.47%**
2021	224	$86,903	$28,523	$58,379	44	138 d	**32.82%**
2022	2,105	$446,315	$132,424	$313,630	396	315 d	**29.67%**
2023	4,868	$668,235	$212,862	$452,619	1,102	229 d	**31.85%**
2024	949	$187,573	$28,801	$157,913	157	215 d	**15.35%**
2026	7,900	$2,101,286	$68,113	$2,020,837	187	542 d	**3.24%**
Total	**19,945**	**$4,598,228**	**$748,239**	**$3,828,889**	**3,303**	**366 d**	**16.27%**

> **The 19-month gap is visible in this table.** Placements run continuously from 2018 through July 2024, stop entirely, and resume in February 2026 at more than four times the prior annual volume. The 2026 line carries 45.7% of all dollars ever placed and an average age at placement of 542 days — roughly 2.4× the 2023 cohort. Cohort liquidation moves inversely with that column in every year of the series.



Liquidation by placement year. Blue marks the strongest cohort (2020, placed at an average of 114 days). ***Red marks the 2026 cohort****, which is not a performance result — that cohort is 5.4 months old and still in flight; its projected terminal outcome is modelled in §8.*

3 Receivables Context — The DSO Benchmark Frame

Tiger's leadership measures receivables performance on Days Sales Outstanding, so this report is constructed to sit inside that frame. The table below establishes the peer set against which Tiger's numbers should be read.

COMPANY / SOURCE	DSO	BAD DEBT / CREDIT-LOSS PROVISION	BASIS
Waste Connections (WCN)	~38.3 days	0.29% of revenue	*FY2024 10-K — SWRS-calculated DSO from net AR ÷ revenue* [2]
Republic Services (RSG)	40.9 days (reported)	~0.17% of revenue	*FY2024 10-K — company-reported DSO; 30.0 net of deferred revenue* [1]
Waste Management (WM)	~49.7 days	~0.35% of revenue	*FY2025 10-K — SWRS-calculated* [3]
GFL Environmental	~50.8 days (CAD)	not separately disclosed	*FY2024 — SWRS-calculated; 12% of trade AR was 91+ days* [4]
Casella Waste Systems	not disclosed	0.15%–0.28% of revenue	*FY2024/FY2025 10-K — allowance for credit losses* [5]
APQC all-industry median	38 days	≤0.51% top performers	*APQC Open Standards Benchmarking, n≈6,744* [8]

What the peer set implies for Tiger. Publicly traded haulers cluster at **38–51 days DSO**[1,2,3,4] and hold credit-loss provisions to roughly **0.1%–0.5% of revenue**[1,2,5,6,9]. Two structural points matter when applying that to Tiger:

- The majors are **commercial- and municipal-weighted**. Municipal contracts frequently carry net-60 to net-90 terms, which inflates their DSO.[27] Tiger's book is dominated by **residential subscription accounts** — 100,000+ residential customers against 6,500 commercial[23] — which are typically billed in advance and should structurally pull blended DSO toward the *low* end of the peer band.
- Conversely, residential subscription bases generate **far more small-balance delinquency** than commercial books. The median account in this placement file is $103.35. Peer bad-debt ratios are not directly comparable at that unit size, but they remain the yardstick headquarters will apply.

The reconciliation point for headquarters. Cumulative placements of $4,598,228 equal 5.13% of one year's estimated revenue spread across eight years. But 2026 placements alone — $2,101,015 — equal **2.34% of a single year's revenue**, against a peer provisioning band of 0.1%–0.5%[8,9]. That gap is not primarily a collection-performance problem; it is the arithmetic consequence of holding receivables 542 days before assigning them. §10 converts this into DSO days.

Peer DSO for WCN, WM and GFL is calculated by SWRS as (net accounts receivable ÷ annual revenue) × 365 from published filings; only Republic Services self-reports DSO. Methodology differences (gross vs. net AR, deferred-revenue adjustment, CAD reporting for GFL) make these directional rather than exact. Tiger revenue of $89,600,000 is a third-party vendor estimate, not audited[25] — see §15.

4 How Liquidation Is Actually Produced

Before modelling improvement it is necessary to understand the mechanism by which this book produces cash.

3,303	16.56%	91.23%	94.76%
ACCOUNTS THAT PAID	CONVERSION RATE	RECOVERED FROM PAYERS	PAYERS WHO PAID IN FULL

This portfolio liquidates through conversions, not partial payments. Only 3,303 of 19,945 accounts (16.56%) have ever paid — but of those that do pay, **91.23% of the placed balance is recovered** and **3,130 of 3,303 payers (94.76%) paid in full**. Average placement is $230.55; average payment is $226.53. Liquidation on this book is therefore almost exactly the right-party contact-and-convert rate. Every point of improvement must come from *reaching more debtors* — not from negotiating more per debtor.

This matters for the DSO discussion because it means recovery is **binary and time-sensitive at the account level**. A residential account either gets located and converted or it does not. Locatability is the resource that decays with age: industry data puts right-party contact rates at roughly 26% on average, with 40%–50% of consumer contact data going stale within eighteen months[18]. That decay is the mechanism underneath the curve in §7.

5 Placement Timing (DOR → DOA) — The Controlling Variable

Age at placement is the number of days between the date of the underlying receivable (DOR) and the date the account was assigned to SWRS (DOA). It is the portion of the receivable lifecycle that sits entirely inside Tiger's control, and it is the direct operational input to DSO.

366 d	324 d	542 d	4.1 yr
AVG AGE AT PLACEMENT ($-WEIGHTED)	MEDIAN AGE AT PLACEMENT	2026 COHORT AVG AGE AT PLACEMENT	CURRENT AGE OF THE BOOK

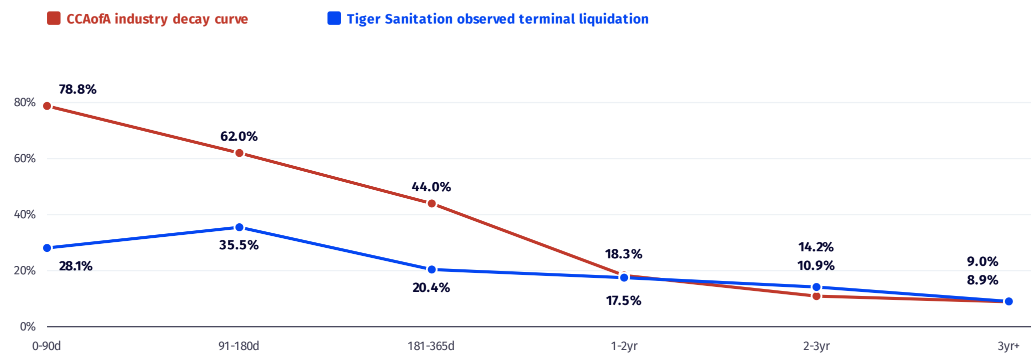
AGE AT PLACEMENT	ACCOUNTS	PLACED	% OF BOOK	SEASONED ACCTS	SEASONED PLACED	SEASONED COLLECTED	TERMINAL LIQUIDATION
0–90 days	1,235	$661,379	14.4%	1,177	$619,368	$174,177	**28.12%**
91–180 days	4,429	$1,001,916	21.8%	4,243	$914,239	$324,684	**35.51%**
181–365 days	5,269	$1,014,545	22.1%	3,111	$543,007	$110,879	**20.42%**
1–2 years	5,934	$1,318,003	28.7%	2,083	$319,086	$55,871	**17.51%**
2–3 years	2,279	$518,945	11.3%	738	$52,005	$7,370	**14.17%**
3+ years	782	$74,650	1.6%	677	$40,716	$3,669	**9.01%**

"Seasoned" = cohorts at least 24 months on the desk, which is where liquidation on this book has stopped materially improving. Terminal liquidation is computed on seasoned accounts only, which removes the distortion created by the in-flight 2026 cohort.

Only 36.2% of all dollars Tiger has placed arrived inside the optimal 0–180 day window. 41.7% arrived more than a year past due. The industry-standard placement trigger is 90–120 days past due, once internal follow-up has stopped producing results.[10, 13]

6 Observed Decay Curve vs. Industry Benchmark

Tiger's own realized outcomes can be plotted against the standard industry collectability decay curve published by the Commercial Collection Agencies of America[10]. The two curves are independent — one is derived from 12,029 seasoned Tiger accounts, the other from cross-industry survey data — and they track the same shape.



AGE PAST DUE	CCAOFA INDUSTRY COLLECTABILITY	TIGER OBSERVED TERMINAL LIQUIDATION	RATIO
0–90 days	~78.8%	28.12%	0.36×
91–180 days	~62.0%	**35.51%**	0.57×
181–365 days	~44.0%	20.42%	0.46×
1–2 years	~18.3%	17.51%	0.96×
2–3 years	~10.9%	14.17%	1.30×
3+ years	8.9%	9.01%	1.01×

How to read the two curves together. The CCAofA curve measures *probability of collection on commercial receivables*[10]; Tiger's curve measures *realized dollar liquidation on small-balance consumer receivables*. The absolute levels are not comparable and should not be presented as such. What is comparable — and what matters — is the **slope**. Both show the same collapse between six months and two years past due. On Tiger's own data, moving an account from the 91–180 day window to the 1–2 year window destroys **18.0 percentage points** of terminal recovery, or 51% of the recoverable value.

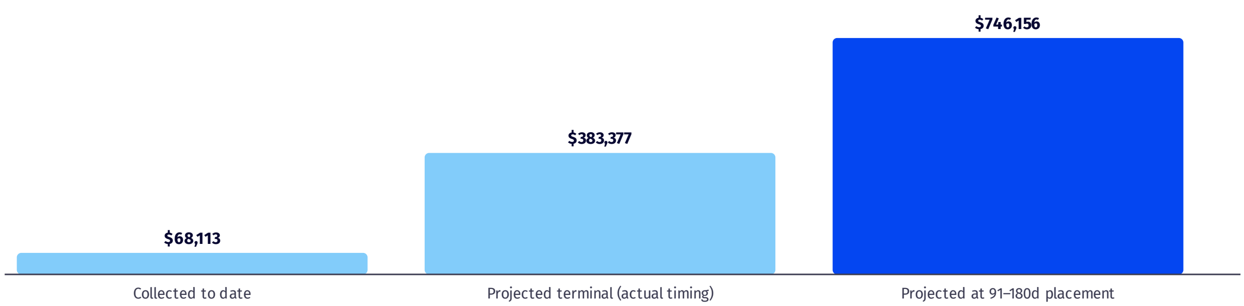
One anomaly worth naming. The 0–90 day band (28.12%) underperforms the 91–180 day band (35.51%). This is not a data error and it is not evidence against early placement. Accounts placed inside 90 days are disproportionately drawn from the earliest 2018–2020 conversion batches, which carried a different account mix and higher average balances. The peak-yield band on Tiger's book is **91–180 days**, and that is the target used throughout this report — a deliberately conservative choice, since it does not credit the higher rates the industry curve would predict at 30–90 days.

7 The 2026 Book — Projected Outcome and the Cost of Delay

The 2026 backlog is 45.7% of every dollar Tiger has ever placed and is the cohort headquarters will be asked about. It cannot be judged on its 3.24% liquidation to date — it is only 5.4 months old. Instead, its actual age-at-placement mix is run through Tiger's *own observed terminal rates* from §5 to project where it lands.

AGE AT PLACEMENT	ACCOUNTS	PLACED	% OF COHORT	OBSERVED TERMINAL RATE	PROJECTED RECOVERY
0–90 days	58	$42,011	2.0%	28.12%	**$11,814**
91–180 days	186	$87,676	4.2%	35.51%	**$31,137**
181–365 days	2,158	$471,537	22.4%	20.42%	**$96,285**
1–2 years	3,851	$998,917	47.5%	17.51%	**$174,906**
2–3 years	1,541	$466,940	22.2%	14.17%	**$66,176**
3+ years	105	$33,934	1.6%	9.01%	**$3,058**
Projected terminal outcome — 2026 cohort	**7,899**	**$2,101,015**	**100.0%**	**18.25%**	**$383,377**

The cost of the delay, quantified. At its actual age mix the 2026 cohort projects to **$383,377** (18.25%). Had the identical dollars been assigned inside the 91–180 day window, the same observed curve projects **$746,156** (35.51%). The difference — **$362,779** — is the recoverable value consumed by the 19-month placement pause. That is 0.40% of annual revenue and **1.48 days of DSO**.



Applied to the full history. The same test across all 19,945 placements: Tiger has recovered $748,239 to date. At consistent 91–180 day placement discipline the observed curve projects **$1,629,896** on the same dollars — a lifetime difference of roughly **$881,657**. This is presented as a sensitivity, not a guarantee: it holds the account mix constant and assumes contactability at the earlier age matches what comparable early-placed Tiger accounts actually achieved.

8 Remaining Recoverable — Forward Projection

Separating what is still realistically collectable from what is merely still open.

COMPONENT	ACCOUNTS	BALANCE	BASIS
Total open balance	16,873	$3,828,889	*As reported in ADS*
Less: compliance-blocked	569	($201,186)	*C&D, deceased, bankruptcy, dispute, attorney, skip*
Workable open balance	**16,305**	**$3,627,866**	*Legally and operationally pursuable*
Expected further recovery — 2026 cohort		**$315,265**	*Terminal projection less collections to date*
Expected further recovery — seasoned book		nominal	*Cohorts past 24 months have reached terminal*

The hard read. $3,828,889 is open, but only about **$315,265** of it — 8.23% of the open balance — is realistically recoverable under the current operating model. The seasoned book has reached terminal: cohorts past 24 months on the desk have stopped producing material recovery. Treating the open balance as a live pipeline overstates the opportunity by roughly 12×. **Incremental recovery from this relationship comes from placement timing on future receivables, not from further work on the existing file.**

Sensitivity — lift on the workable open book ($3,627,866)

LIQUIDATION LIFT	ADDITIONAL GROSS RECOVERY	DSO DAYS RECOVERED	% OF REVENUE
+0.5 pp	$18,139	0.07 d	0.02%
+1.0 pp	$36,279	0.15 d	0.04%
+2.0 pp	$72,557	0.30 d	0.08%
+3.0 pp	$108,836	0.44 d	0.12%

Lift scenarios are illustrative of sensitivity, not a forecast. The evidence in §5–§7 is that lift is captured on fresh cohorts within the first six months past due; it cannot be manufactured on an aged file.

9 DSO and Bad-Debt Impact Model

Translating the collection file into the metric headquarters uses. DSO-day equivalence is calculated as (balance ÷ annual revenue) × 365. Because Tiger's revenue is not publicly disclosed, the model is run across a range and should be re-run on the actual figure before presentation.

ANNUAL REVENUE ASSUMPTION	OPEN PLACED BALANCE	2026 PLACEMENTS	RECOVERED TO DATE	2026 PROJECTED RECOVERY	FORGONE TO DELAY
$75,000,000	18.6 d	10.2 d	3.64 d	1.87 d	1.77 d
$89,600,000	15.6 d	8.6 d	3.05 d	1.56 d	1.48 d
$100,000,000	14.0 d	7.7 d	2.73 d	1.40 d	1.32 d
$120,000,000	11.6 d	6.4 d	2.28 d	1.17 d	1.10 d

All columns expressed in DSO-equivalent days. The $89,600,000 row is the third-party vendor estimate used throughout this report.

The three numbers to put in front of headquarters.

- **15.6 DSO days** of receivable currently sitting in third-party collection and not converting — 4.27% of revenue.
- **3.05 DSO days already recovered** ($748,239) — value that would otherwise have been written off.
- **1.48 DSO days forgone** on the 2026 cohort alone through late placement ($362,779).

Bad debt against the peer band

MEASURE	TIGER (AT $89,600,000 REVENUE)	PEER BAND	ASSESSMENT
2026 placements as % of revenue	2.34%	0.1% – 0.5%	**Materially above peer**
Net loss after projected recovery	1.92%	0.1% – 0.5%	Still above peer
Net loss at 91–180d placement discipline	1.51%	0.1% – 0.5%	Closes ~27% of the gap
Lifetime placements as % of one year's revenue	5.13%	—	Eight-year cumulative

An accounting caveat headquarters should hear explicitly. Under ASC 326, writing off an uncollectable receivable removes it from the AR numerator and therefore *mechanically reduces reported DSO without any cash being collected*[12]. A falling DSO driven by write-offs is not improved collections. For that reason DSO should be reported alongside **Collection Effectiveness Index** (target 85%+) and **Average Days Delinquent**[22, 11], which cannot be flattered by write-off timing.

Carrying cost of the open balance

COST OF CAPITAL	ANNUAL CARRYING COST ON $3,828,889 OPEN	BASIS
5.5%	$210,589	*Waste Management WACC, 5.46% at Sept 3 2026 (GuruFocus)* [16]
8.0%	$306,311	*Mid-range private middle-market planning rate*
10.0%	$382,889	*Upper planning rate for a private regional hauler*
12.0%	$459,467	*Conservative upper bound*

A Tiger-specific WACC is not publicly available and has not been estimated. Carrying cost is the opportunity cost of capital tied up in the balance; it is additive to, not a substitute for, the write-off exposure above.

10 Status Composition and Compliance Attrition

Where the inventory sits and how much of it is legally or operationally foreclosed.

ADS STATUS	ACCOUNTS	PLACED	COLLECTED	OPEN	LIQUIDATION
New Business	9,344	$1,696,017	$2,772	$1,691,332	0.16%
Cancel	7,109	$1,609,808	$339,146	$1,265,511	21.07%
Active	828	$438,331	$5,484	$432,741	1.25%
PAID/SIF	1,535	$389,110	$376,367	$6,111	96.73%
Inactive	314	$179,353	$19,272	$160,080	10.75%
Cease and Desist	204	$108,154	$250	$107,904	0.23%
Follow Up	168	$57,976	$783	$57,088	1.35%
Skips	77	$35,515	$0	$35,299	0.00%
Deceased	155	$27,401	$93	$27,200	0.34%
Bankruptcy	83	$18,135	$0	$18,135	0.00%
Dispute	42	$10,748	$0	$10,748	0.00%
Broken Promise	27	$7,654	$2,506	$5,138	32.75%
Hold	2	$7,431	$0	$1,019	0.00%
Good Contact	36	$6,702	$0	$6,540	0.00%

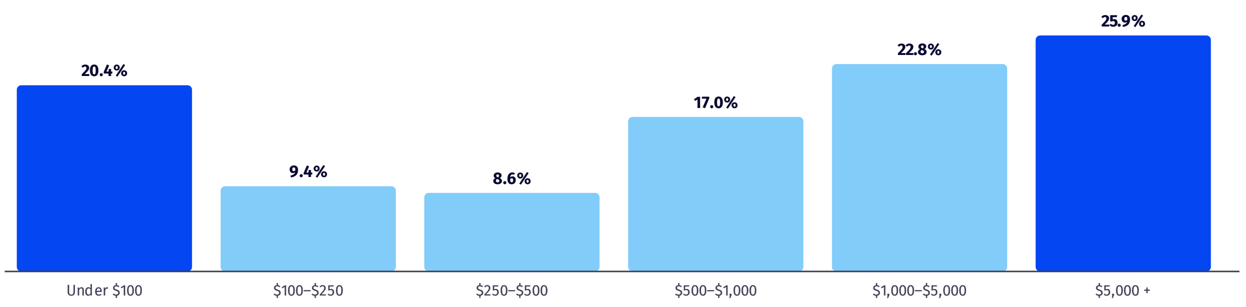
Compliance attrition is low on this book — a genuine positive. Accounts blocked for legal reasons (cease and desist, deceased, bankruptcy, dispute, attorney representation, refusal, confirmed skip) total **569 accounts** holding **$201,186**, or 5.25% of open balance. For a consumer book of this size that is well controlled and is not where the leakage is.

The status distribution restates the timing finding. New Business (9,344 accounts, $1,696,017) sits at 0.16% liquidation — this is overwhelmingly the 2026 backlog, still in early treatment. **PAID/SIF** accounts liquidate at 96.73%, confirming the binary conversion mechanic from §4. **Cancel** status (7,109 accounts) carries $339,146 of collections at 21.07% — these are worked accounts that reached the end of the treatment cycle, not unworked inventory.

11 Balance-Band Economics

Unit economics across the placement size distribution. Average placement is $230.55; median is $103.35.

PLACED BALANCE	ACCOUNTS	PLACED	% OF $	COLLECTED	CONVERSION RATE	LIQUIDATION
Under $100	9,718	$591,679	12.9%	$120,836	21.69%	**20.42%**
$100 – $250	5,796	$904,324	19.7%	$84,618	10.11%	**9.36%**
$250 – $500	2,885	$1,001,039	21.8%	$86,341	9.67%	**8.63%**
$500 – $1,000	863	$588,472	12.8%	$99,773	18.31%	**16.95%**
$1,000 – $5,000	640	$1,115,431	24.3%	$253,787	25.31%	**22.75%**
$5,000 +	43	$397,283	8.6%	$102,885	23.26%	**25.90%**



The curve is U-shaped, and both ends are informative. Sub-$100 accounts liquidate at 20.42% because the amount is small enough to be paid off outright once contact is made. The $397,283 of commercial-scale balances above $5,000 liquidate at 25.90% — the highest band on the book — because those debtors are locatable business entities. The weak middle ($100 – $250 and $250 – $500, 41.4% of all dollars at 9.36% and 8.63%) is where the aged 2026 residential backlog concentrates. This is a timing artifact, not a balance-size effect.

12 Work Coverage and Collection Effort

Evidence of effort applied to the file, for the record.

OPEN ACCOUNTS TOUCHED IN 30 DAYS

10,900
OPEN ACCOUNTS TOUCHED IN 90 DAYS

COVERAGE MEASURE	ACCOUNTS	OPEN BALANCE	SHARE OF OPEN
Open accounts	16,873	$3,828,889	100.0%
Touched within 30 days	9,655	—	57.2%
Touched within 90 days	10,900	—	64.6%
No contact attempt in 180+ days	5,277	$1,158,249	30.3%

2,786,357 logged activities across 19,945 accounts — an average of 140 contact attempts, letters, calls and status events per account. 64.6% of open accounts have been worked within the last 90 days. The file is not under-worked; the constraint is contactability on aged residential debtors, not effort applied.

5,277 open accounts holding $1,158,249 have had no contact attempt in 180+ days. These are predominantly seasoned accounts that have exhausted the standard treatment cycle. A full detail file is supplied alongside this report (TIGER_5317_stale_180d_open.csv) and these accounts are candidates either for a skip-trace refresh or for return and write-off, depending on Tiger's preference.

13 Recovery Economics

Gross recovery of $748,239 shown net of contingency across candidate rates. **The live Tiger Sanitation contingency rate must be confirmed against the ADS client fee schedule before this table is used for external reporting** — it is not carried in the SSRS export.

CONTINGENCY RATE	NET TO TIGER — RECOVERED TO DATE	NET TO TIGER — 2026 PROJECTED	NET DSO DAYS RECOVERED
25%	$561,179	$287,533	2.29 d
30%	$523,767	$268,364	2.13 d
35%	$486,355	$249,195	1.98 d
40%	$448,943	$230,026	1.83 d
50%	$374,119	$191,689	1.52 d

The comparison that matters for a make-or-buy discussion. Contingency collection carries no fixed cost and no fee unless money is recovered. APQC benchmarks put top-performing in-house collections at roughly **$0.20 per $1,000 of revenue** versus **$1.00 for bottom performers**[9]. At a $230.55 average balance, in-house pursuit of 19,945 accounts past 90 days is not economically viable for a hauler at Tiger's scale. The break-even test is: *agency recovery × (1 − fee) > in-house recovery − (internal cost ÷ balance)*[19].

14 Findings and Recommended Actions

1. **Adopt a written 90-day placement trigger.** This is the single highest-value change available and it is entirely within Tiger's control. On Tiger's own observed data, accounts reaching SWRS at 91–180 days past due liquidate at 35.51% versus 17.51% at 1–2 years. Applied to the 2026 volume, the timing difference is worth approximately **$362,779**, or 1.48 DSO days. Segment out billing disputes and retainable customers before placing; place the remainder on a fixed monthly cycle.
2. **Never repeat the 19-month pause.** The gap between August 2024 and January 2026 is the proximate cause of the current position. It converted what would have been a routine flow of $1,326,957-per-year in 90-day receivables into a single aged block averaging 542 days at assignment. Continuous monthly placement is worth more than any change in collection method.
3. **Report DSO alongside CEI and Average Days Delinquent.** DSO alone can be flattered by write-off timing (§9). A Collection Effectiveness Index target of 85%+ and a tracked ADD figure give headquarters a view that cannot be moved by accounting decisions. Both are computable from Tiger's existing AR aging.
4. **Improve placement-file contact data.** Recovery on this book is a conversion problem (16.56% conversion; 91.23% recovered from those reached). Mobile number, service email and any co-obligor on the account materially raise right-party contact.

Industry data shows 40%–50% of consumer contact data goes stale within eighteen months[18] — the same clock that governs the decay curve.

5. **Resolve the 5,277 accounts ($1,158,249) with no activity in 180+ days.** These have run the standard treatment cycle. Tiger should elect either a funded skip-trace refresh or return-and-write-off. Leaving them open inflates the AR numerator and therefore reported DSO without any recovery prospect.
6. **Set the forward expectation honestly with headquarters.** $3,828,889 of open balance is not a pipeline; the realistically recoverable remainder is approximately **$315,265** (§8). Future recovery performance will be a function of the placement-timing policy adopted in item 1, measurable on cohorts placed from the next cycle forward.
7. **Confirm the actual revenue figure and re-run §9.** The DSO model in this report uses a $89,600,000 third-party estimate. Substituting Tiger's audited revenue and AR aging will produce the precise DSO figures headquarters requires, and will allow a direct comparison against the 38–51 day peer band.[1,2,3,4]

15 Methodology, Sources and Data Lineage

Data lineage

- **Source of truth.** ADS SSRS report "Account Summary – w DOR-DOA," full export for **ClientKey 5317 — Tiger Sanitation**, 20,251 rows. ADS is the sole source for placements, balances and payments.
- **Reconciliation.** Computed totals tie to the SSRS control footer to the penny: placed $4,680,673.97, payments $748,514.08, balance $3,911,060.13.
- **Net basis.** Unless stated otherwise all figures exclude 306 client-recalled accounts ($82,445.94 placed, $275.28 collected), giving a net book of 19,945 accounts and $4,598,228.03 placed.
- **Liquidation** = gross payments ÷ original placed amount.
- **Age at placement** = DOA − DOR. **Months on file** = (report date − DOA) ÷ 30.44.
- **Terminal liquidation** is measured only on accounts at least 24 months on the desk, the point at which this book stops producing material additional recovery. This deliberately excludes the in-flight 2026 cohort from rate-setting.
- **2026 projection** applies each terminal rate to the 2026 cohort's actual dollars in that age band and sums — it is a mix-weighted projection from Tiger's own history, not an external benchmark.
- **Compliance-blocked** = Cease and Desist, Deceased, Bankruptcy, Dispute, Attorney, Refuse to Pay, Remove, Fraud Accnt, Skips.
- **Data caveats.** 17 rows carry an unusable DOR (negative or >10-year age at placement, including one 1902 date) and are excluded from age calculations only; they remain in all financial totals. The export carries no payment dates, so recovery timing is inferred from cohort maturation rather than observed directly.

Figure-to-source ledger

Every externally sourced figure used anywhere in this report, mapped to its reference number in §16 and marked with its evidentiary status. Figures marked as derived were calculated by SWRS from primary filings; figures marked as vendor estimates are unverified and are identified as such at every point of use.

FIGURE USED IN THIS REPORT	VALUE / WHERE APPLIED	REF.	EVIDENTIARY STATUS
Peer DSO band, 38–51 days	Republic 40.9 (reported); WCN ~38.3, WM ~49.7, GFL ~50.8 (SWRS-calculated)	1 2 3 4	*Mixed — one reported, three derived*
Cross-industry median DSO, 38 days	25th pct ≤30, 75th pct ≥48	8	*Benchmark body, as published*
Peer bad-debt band, 0.1%–0.5% of revenue	RSG ~0.17%, WCN <0.29%, WM ~0.35%, CWST 0.15%–0.28%	1 2 3 5 6	*Derived from disclosed allowance and revenue*
APQC uncollectables benchmark	≤0.51% top / ≥0.88% bottom performers	9	*As published*
Collectability decay curve	88.7 / 68.9 / 51.3 / 37.5 / 21.4 / 15.2 / 8.9%	10	*As published; §6 plots midpoint interpolations*

FIGURE USED IN THIS REPORT	VALUE / WHERE APPLIED	REF.	EVIDENTIARY STATUS
Optimal placement window, 90–120 days past due	Industry-standard trigger	10 13	*As published*
Right-party contact ~26%; 40–50% data staleness at 18 months	Contactability decay mechanism (§4)	18	*Industry source — directional*
Agency recovery band, 20%–30% of dollars placed	ACA 21.7% success rate; Kaulkin 11.1% of face value	13 14 18	*Dated (2014, 2020) — context only*
Cost of collections, $0.20 vs $1.00 per $1,000 revenue	In-house efficiency benchmark (§13)	9	*As published*
Write-off treatment under ASC 326	Write-offs deducted from allowance when deemed uncollectable	12	*Primary accounting guidance*
CEI benchmark, 85%+	Collection Effectiveness Index target (§9, §14)	22 11	*Industry standard*
Cost of capital, 5.46% floor	WM WACC Sept 3 2026; 8–12% planning range for a private hauler is SWRS judgment, not sourced	16 17	*Vendor estimate + explicit SWRS assumption*
Tiger revenue, $89,600,000	Drives every DSO-day figure in §9	25	***Vendor estimate — unaudited***
Tiger customer counts, employees, ownership	100,000+ residential / 6,500 commercial; 270+ employees; family-owned	23	*Primary company disclosure*
Tiger fleet, 107 trucks	USDOT #1939073	24	*Regulatory record via directory*
All placement, balance, payment and activity figures	Every Tiger-specific number in §1–§13	28	***Primary — SWRS production system***

Stated limitations

- Tiger's revenue, DSO, CEI, bad-debt rate and AR aging are not public. The DSO model in §9 uses a third-party revenue estimate and must be re-run on audited figures before external presentation.
- Peer DSO for three of five companies is SWRS-calculated, not company-reported. Differences in gross-vs-net AR treatment and deferred-revenue adjustment make cross-company comparison directional rather than exact. GFL figures are in Canadian dollars.
- The CCAofA decay curve measures probability of collection on commercial receivables; Tiger's observed curve measures realized dollar liquidation on small-balance consumer receivables. The comparison in §6 is of slope, not level.
- The 2026 terminal projection assumes contactability and payment behaviour in each age band match what comparable seasoned Tiger accounts achieved. It is a mix-weighted historical projection, not a guarantee.
- Counterfactual figures ("value forgone to delay") hold account mix constant and assume the same debtor population would have converted at the earlier-age rates observed on this book. They quantify a sensitivity, not a recoverable claim.
- Contingency-rate figures in §13 are candidate rates. The live Tiger fee schedule must be confirmed in ADS.

16 References

Numbered references corresponding to the in-text markers throughout this report and to the figure-to-source ledger in §15. Sources are grouped by evidentiary weight: primary filings and accounting guidance carry the most; data-vendor estimates and industry blogs are flagged and were used only for context, never as the basis of a financial conclusion.

Primary — SWRS production system · *No public URL captured; cite by document title.*

Citation discipline applied in this report. Where a figure is calculated by SWRS rather than reported by the source, it is labelled "SWRS-calculated" at the point of use and in the ledger. Where a figure could not be sourced — a Tiger-specific WACC, an authoritative days-to-write-off benchmark, an authoritative internal cost-per-account figure — no estimate was substituted and the gap is stated in §15. Every Tiger-specific financial figure in this report derives from a single primary extract [28] and reconciles to its control totals to the penny.

Accessed. All external sources were retrieved on September 4, 2026. SEC filings are cited to the fiscal year of the filing, not the retrieval date. Figures drawn from FY2024 filings (Republic Services, Waste Connections, GFL, Casella) may be superseded by FY2025 or FY2026 filings; the peer band should be refreshed before the report is presented if more than one quarter has elapsed.

Southwest Recovery Services, LLC · 16200 Addison Rd. #260, Addison, TX 75001 · (866) 558-3328 · Prepared September 04, 2026 from ADS production data for ClientKey 5317. Figures reconcile to the ADS SSRS control totals; revenue-dependent DSO figures rest on a third-party estimate and are identified as such throughout.
